

Build GREEN with API

API is committed to using resources efficiently and minimizing the environmental impact of all our business operations. Please find a brief overview of API's Green Initiatives with respect to the materials and processes that are being utilized by our company:

GREEN INITIATIVES

RECLAIMED WATER

API has adopted a GREEN Initiative to use reclaimed (recycled) water in all of our warehouse and production facilities. This effort helps protect the sensitive watersheds throughout our region (a region that is extremely susceptible to droughts).

THERMALLY BROKEN

API offers thermally broken storefront systems that reduce energy consumption and save energy.

SUN CONTROL

Sun Control systems are growing in popularity due to their ability to limit sunlight and lower energy costs.

METALS - STOREFRONT & BRAKE/SHEET METAL

All aluminum and steel materials produced and manufactured by API include a high content of recycled materials. By recycling old metals, API is able to use less energy than manufacturing from new materials.

POWDER COATING

The Powder Coating process that API has adopted has been accepted and specified as the Best Available Control Technology (BACT) to reduce air pollution. Powder Coating has eliminated the volatile organic compounds (VOC's) that have for many years polluted our air.

WINDOW FILM

Window Film is designed to reduce the amount of solar heat transmission through window glass by increasing the solar reflection and absorption. Window film can reduce the energy exerted by your internal heating and cooling systems by up to 50%.

BENEFITS

RECYCLED MATERIAL

REDUCE ENERGY

DECREASE LAND AND WATER POLLUTION

MINIMIZE ENVIRONMENTAL IMPACT

CUT GREENHOUSE EMISSIONS

ENHANCE BUSINESS OPERATIONS

CUT COSTS
