Specifications for
Transparent / Translucent
Powder Coat Color
Inconsistencies
2 Pages

Transparent / Translucent powder coats are made to produce an inconsistent finish on a finished product. Often times, the metal substrate will show through the powder coat. There are many uses for this type of finish and the final visual effect is extremely appealing (see photos on Page 2).

The color variation can range from very mild to dramatic, making it impossible to achieve a consistent finish / color match between different pieces of material. It should be noted that an individual piece of material will often have extreme color variations as well (even when the powder coat is applied from the same box of powder coat). Further, achieving a consistent, inconsistent finish is not possible.

When requesting and / or approving a Transparent / Translucent powder coat for your project, you should expect a color variation on your materials and understand that guarantees of finish, whether it is to match more to the lighter or darker spectrum or to produce material in a similar color range, can unfortunately not be made. Further, viewing conditions such as light source, viewing angle, and viewing distance may influence visual appearance of the finished material.

Please sign and date this letter as your acceptance of the product specifications listed above and as your acknowledgement that you have viewed the photos and understand the inconsistent nature of Transparent / Translucent powders. Please fax this to (813) 925-1414 or email it to info@americanprod.com.
